Total 12 States	106050	120130	113886	76.72	72.96	60.20	8137	8765	6781

1/ Production includes both sweet and sour cherries.

2/ Estimates of total production based on commercial sales, plus allowances for local sales, home use, etc.

3/ Sweet 2080 T; sour 25,370 T.

4/ Sweet 1400 T; sour 11,440 T.

Cherry production in the 12 important producing States in 1936 was 12 percent less than the 1935 crop and was 2 percent below the 5-year (1928-32) average. A total of 106,050 tons is estimated to have been produced in 1936 compared with a crop of 120,130 tons in 1935 and with the 5-year average production of 107,896 tons. Production was above average in Michigan, Utah and in the Pacific Coast States, but this was more than offset by losses in New York, Ohio, Wisconsin and the Rocky Mountain States where cherries were badly injured by spring freezes.

More Cherry Trees.

The number of cherry trees of bearing age in the United States increased by more than one-third from 1930 to 1935. About one-fourth of all cherry trees in the country were of non-bearing age in 1935. Considering the total number of trees and the percentage not yet of bearing age, it appears that cherry production in the next five years will be as high, if not higher, than in the last five years. Plantings in the last few years have been little more than enough to take care of replacements, but it is believed that enough young trees will come into bearing to more than offset normal losses and removals.

Prices of cherries have been rising slowly during recent years with better demand conditions. During the next year or two they will probably not advance very much if production is about as expected.

--From The Farm Outlook for 1937. USDA Pub.#255.
